Profile

Computer science student at TU Dortmund, open to working student roles (up to 80 h a month). I build tools that make complex systems easy to see: a map for unfamiliar code, an AI ad workspace, and a portfolio room with its own editor.

Projects

PRISM *TypeScript, React, Node.js, PostgreSQL · Aug 2026 – present*

- AI workspace for e-commerce sellers that turns product information into audiences, angles, offers and campaign-ready ad sets; used by an e-commerce seller for his real ad campaigns.
- Designed the workflow so every decision keeps its relationships: audiences, angles and offers are saved records that are combined into ad sets, not one-off prompts.
- AI generation is tied to saved records and a log of every step, so each result can be traced back to the product context and the choices that produced it.
- Connected the OpenAI and Claude APIs to the workflow and kept their output inspectable and reusable.
- Structured product input into audiences, angles and offers, so a seller can run several marketing experiments side by side.
- Built solo, end to end: React and TypeScript frontend, Node.js backend and PostgreSQL database.

Portfolio Room *JavaScript, Node.js, Canvas 2D · Oct 2026*

- Portfolio built as a pixel-art room you walk through to reach projects, CV and contact links.
- Wrote the Canvas 2D rendering and the pathfinding myself, without a framework, including furniture that the character can walk behind.
- Built a private visual editor for the room's interaction zones, collision areas and floor, plus an animation page for the character's sprite sheets.
- Own CMS in 4 languages with conflict-safe saves, so edits from two browser tabs never overwrite each other.
- Project cards open into a detail view with photo, GIF and video slideshows for every project.
- One-click publishing to GitHub Pages through an automated Git workflow; the public site stays fully static.

Code Atlas *JavaScript, Python analysis, React Flow · Apr – May 2026*

- Code-exploration tool that turns an unfamiliar JavaScript or Python repository into a visual map of files, functions and dependencies, with risk signals and simulated refactors.
- Built a deterministic analysis pipeline: source code becomes dependency graphs, risk signals and refactor simulations without any AI involved.
- Static analysis mapped Facebook's React repository into a dependency graph in about 4 minutes.
- Navigable map in React Flow with structural clusters, so the first hours in a new codebase go faster; it supports reading the code, it does not replace it.
- Deployed as a live demo.

Skills

Frontend	JavaScript, TypeScript, React, React Flow, Canvas 2D, HTML, CSS
Backend & AI	Node.js, Python, PostgreSQL, OpenAI / Claude APIs
Tools	Git, GitHub, GitHub Pages
Languages	Arabic (Tunisian), French, English, German (B2–C1)

Education

TU Dortmund 2023 – 2028 (expected)
B.Sc. Computer Science, 8th semester
